20. ABSTRACT (Continue on reverse side if necessary and identify by block number)

The Upper Millpond Dam is located on the Indian River in Clinton, Connecticut. The overall length of the dam is 82.5 feet including a stone masonry spillway of 24.5 feet located near the left side. The dam is in fair condition with some cracking and spalling of the concrete cap, no functioning outlet workds, several large overhanging trees just upstream of the dam, measurable seepage around the left abutment and some misalignment of the stone masonry dam itself.

Re: Upper Millpond Dam Clinton, Connecticut Contract # DACW -33-81-C0017

The Department of the Army New England Division Corps of Engineers 424 Trapelo Road Waltham, Massachusetts 02154

Attention: Mr. E. P. Gould, Project Management Division

Gentlemen:

We have inspected Upper Millpond Dam and conducted a field survey of the site. Our dam failure analysis concludes that the dam should be reclassified as having a low hazard potential.

We are including with this letter a short report substantiating our conclusions.

Very truly yours,

PHILIP W. GENOVESE & ASSOCIATES, INC.

### DESCRIPTION

Name of Dam : Upper Millpond Dam

Identification Number: CT 00390

Town : Clinton

County and State : Middlesex County, Connecticut

Stream : Indian River

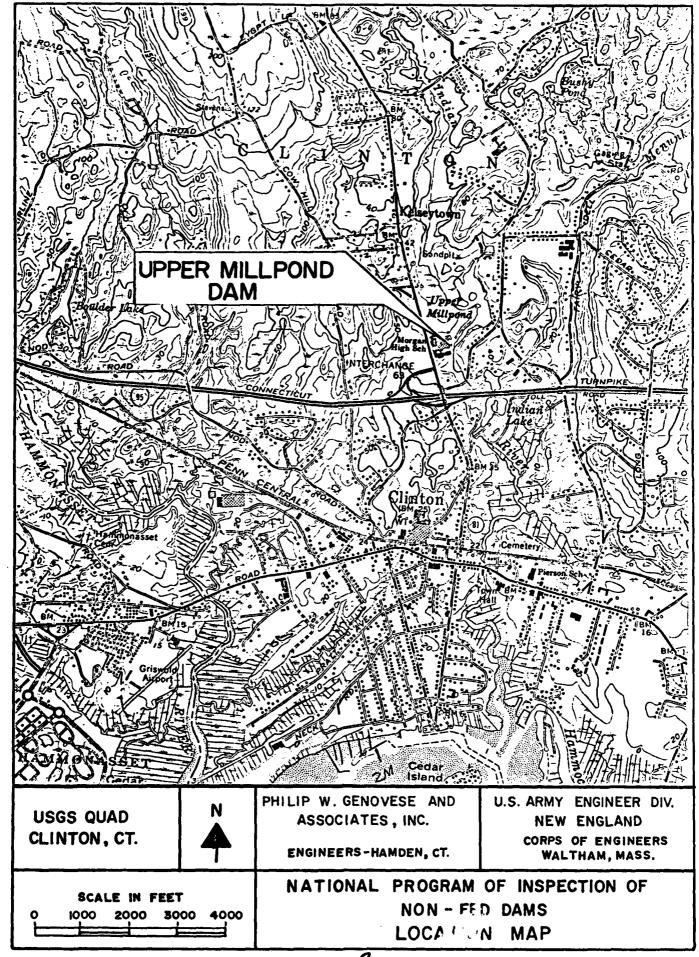

Owner : Town of Clinton, Connecticut

Date of Inspection: November 20, 1980

The Upper Millpond Dam is located on the Indian River in Clinton, Connecticut. The dam was constructed in 1813. The overall dam length is 82.5 feet including a stone masonry spillway of 24.5 feet located near the left side. There is a concrete cap, approximately 8 inches high by 1 foot wide which was added to the dam on other side of the spillway in 1975. On the right side of the dam is the remains of an outlet box which is partially collapsed. Also, located beneath the spillway is a plugged 10-inch metal outlet pipe. The maximum height of the dam is 8.2 feet and the average depth immediately behind it is 1 foot.

The dam is owned and operated by the Town of Clinton. The dam impounds Upper Millpond which is 16.5 acres in size and which is essentially a widened channel of the Indian River.

The dam is in fair condition with some cracking and spalling of the concrete cap, no functioning outlet works, several large overhanging trees just upstream of the dam, measurable seepage around the left abutment and some misalignment of the stone masonry dam itself.

CLINTON, CONNECTICUT

Same and the same of the same

### HYDROLOGIC/HYDRAULIC EVALUATION

Upper Millpond Dam has a tributary drainage area of 6,55 square miles, a surface area of 16.5 acres at spillway height and a storage capacity of 39.6 acre-feet at spillway level and 56.1 acre-feet at the top of dam. The maximum height of the dam as measured from the stream bottom to the top of dam is 8.2 feet. In accordance with Table I of the Corps of Engineers Recommended Guidelines for Safety Inspection of Dams this dam is classified as "small" in size based on storage capacity.

The spillway design flood of 1801 cfs (1/2 PMF) could not be passed through the dam without overtopping occurring. In this case it resulted in a surcharge of 3.0 feet as the spillway is only capable of passing 76 cfs before the dam is overtopped.

A dam breach analysis was made using the Corps of Engineers method of estimating the peak discharge from a breached dam. This resulted in a flow of 913 cfs. In this case rather than use the Corps of Engineers "Rule of Thumb" guidance for estimating downstream flood hydrographs we utilized the results of a detailed stream backwater analysis performed on this section of the Indian River. The analysis was completed in 1978 for the Clinton Flood Insurance Study (FIS) and is included as Reference 1. The use of these profiles will actually result in conservative flood heights as there is no accounting for channel storage and resultant decreases in peak discharges downstream of the dam. However, the conclusion that the profiles illustrate is that there is little chance of loss of life or economic damage from a dam breach. The floodwaters would be largely attenuated by a 6.4 acre pond 1600 feet downstream of the dam, along with a wetlands 5800 feet downstream of the dam.

The calculations used in this analysis, including the pertinent sections of the Clinton FIS are included as Appendix D.

donc for Clinton Indicates a 100 yr.
flood flow gust dls of this dom
site of 1057 CFS and a 500 yr.
flood flow of 1921 CFS. Therefore a
Vz PRIF of 1801 CFS Seems reasonable.
The volume of this to PAF 15

\$\frac{19"}{2\left(\frac{19"}{12\pi\_0\right)}\left(6.55 A12\right)\left(640 AC/\mu\_12\right) = 3319 AC-FT

This same Flood Study has stream profiles for the 10,50, 100 \$ 500 year floods on the Indian River. We have plated the dam rating curve figures from the report onto semi-log paper on page 3 and projected the exported elevation for a V2 paper. We have then checked these results against our rating curve shown below and find they compare forwardly,

Our conclusion then is that the dam will be overtopped for the 12 PMF. Short cui routing -Qp = 1801 CFS = eAV = 28,1 MSL Stor, = 107.2 AC-FT (Stor = 1(b)(h) + bxh = /3(16.5)(7.2) + 16.5 (4.1) = 107.2 AC-FT) 107.2 AC-FT X 12" = 0.31 " of runufg 6.55 M12 (640 AC/N/2) FT Op; = Op (1- stor) (1- 131) = 1742 CFS :. Elev 28.0: (Negligible difference) DAM BREACH ANALYSES Qo = 8 (0.4) Wb Vg /6 3/2 Qp = 8 (0.4) (60) [322 (8) 3/2 272 EIP = 90 This flow is almost identical to the FIS SO year storm of 897 crs for which we already have a detailed flood 100Hing (pages 5 + 6). In addition we have graphed there recults against on own field sections (p. 948) and find Them to be in close agreement. Areliminary evaluation of othertures on a USGS map along with a feeld inspection-indicates Here is little the chance of loss of life. Pages 9-12 re-evaluate this situation.

H

Upper Mill pon & Dain

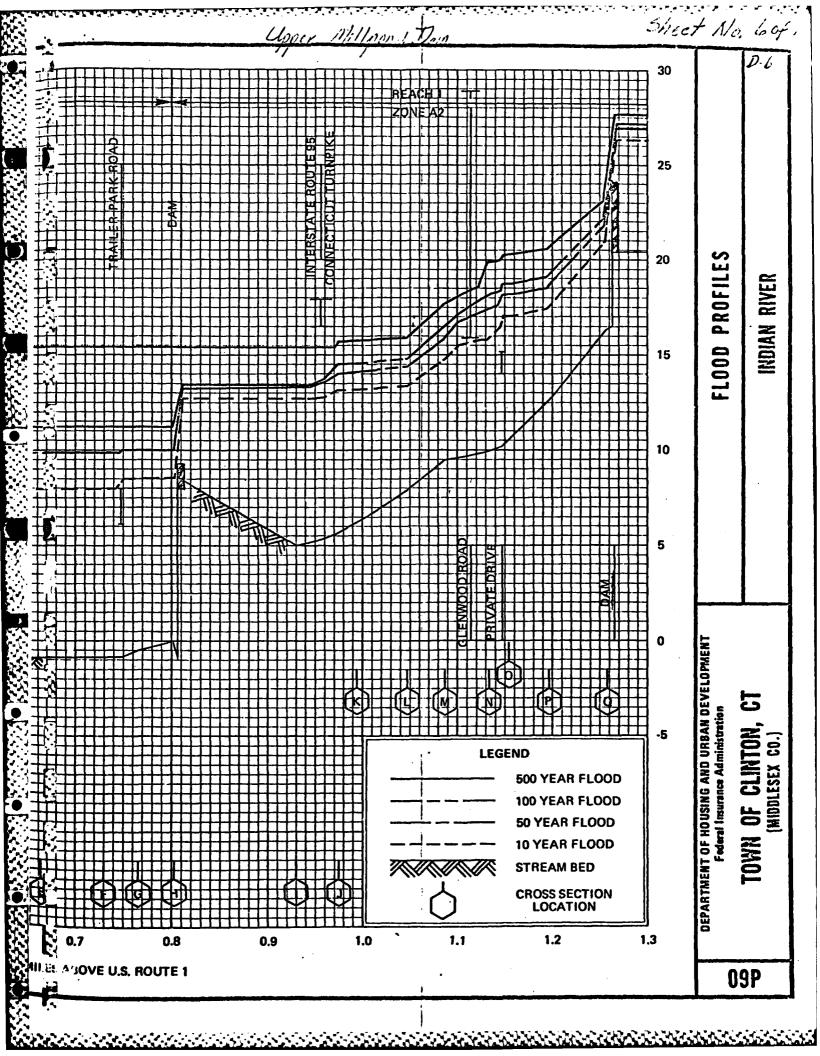

The Regional Frequency Method was used to compute all peak discharges (Reference 5). Due to the inherent possibility of a large standard error in the Regional Frequency Method, comparative computations of discharges by the rainfall-runoff technique based on the Synthetic Triangular Unit Hydrograph and the SCS Methodology were also utilized for assisting in the adoption of discharges for various frequencies in a smooth curve (References 6 and 7).

Peak discharges were similarly computed for the Hammonasset River and compared with peak discharges published in the Flood Insurance Study for the adjacent Town of Madison (Reference 8). To maintain uniformity in the Flood Insurance Studies from one community to another, and since the computed discharges compared favorably to the upstream published discharges, the published discharges were adopted for use. These discharges were adjusted downstream of Madison by a method developed by the SCS utilizing a discharge-area relationship (Reference 9).

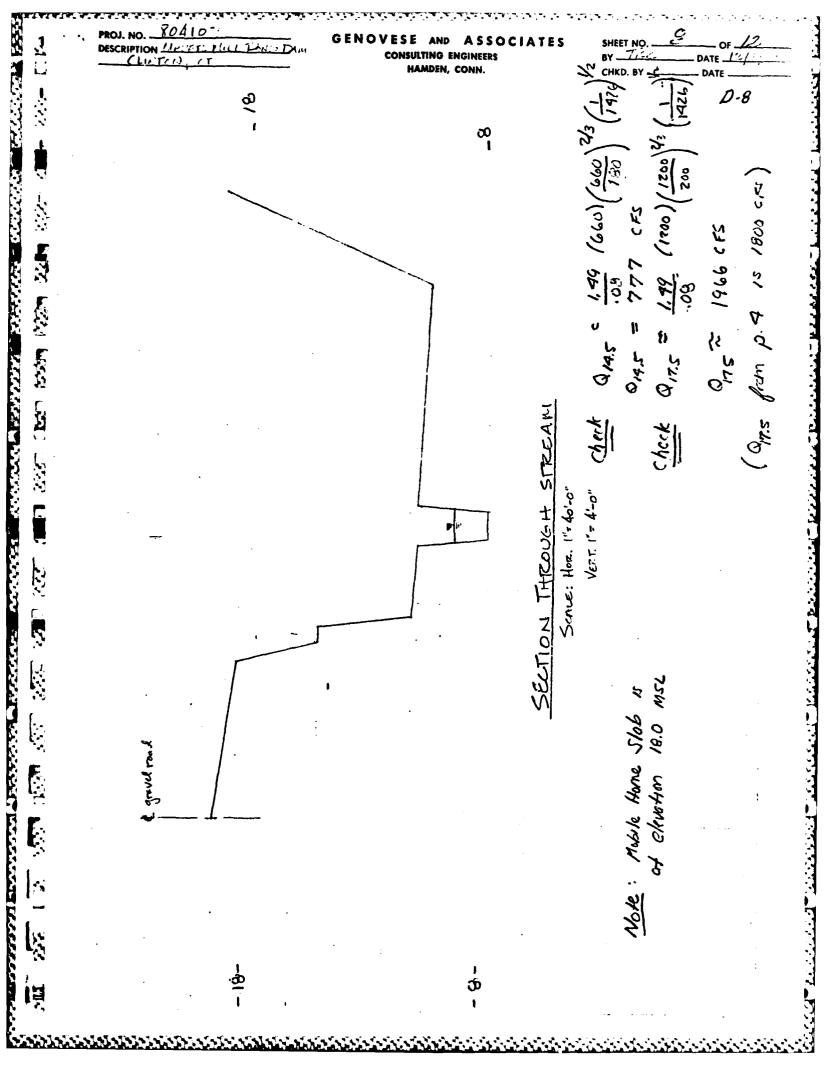

A summary of drainage area-peak discharge relationships for the streams studied by detailed methods is shown in Table 1, "Summary of Discharges." Figures 2 through 7 show the potential 100- and 500-year flood levels on detailed study streams in Clinton.
